

2017 'Ganza Wimp Factors

LEGEND:

"Pts" are the number of "upset points" your bracket contained. An upset point is defined as the value of an upset you picked. For example, if you picked a #8 seed to lose in the 1st round, you would be credited with 1 upset point (since they should lose in the second round). If you picked a #1 seed to lose in the 1st round, you would get 4 upset points (since they should go to the final four). If you picked a #2 seed to lose in the 2nd round, you would get 2 upset points (since they should have lost in the fourth round). Upset points are not calculated in the final four, since it's difficult to say that a 1 seed beating a 1 seed is an upset.

"Got" is the number of upset points you picked that you actually got correct.

"Ratio" is the number of correct upset points divided your total upset points.

"W Fact" is your wimp factor, determined by subtracting your upset points from the maximum number of upset points (60), and dividing by the maximum number. The higher the Wimp Factor number, the wimpier your picks were.
